

THE PROBLEM

\$4.44M

average cost of a cloud data breach

Of that:

\$1.47M

is just detection and escalation

A misconfigured bucket or open security group is almost never caught by someone reviewing a console. It's caught by what's watching continuously.

AGENTICSECOPS: BUILD VS. BUY — MODULE 3

HOW IT WORKS

CSPM agent architecture

AGENTICSECOPS: BUILD VS. BUY — MODULE 3

THE COST MATH

BUILD IT YOURSELF

\$15K

one-time build, 3-5 weeks

\$200-500

per month to run

+ ~0.2 FTE ongoing

BUY IT (BUNDLED CNAPP)

\$2K-8K

per month, ongoing

= \$24K-\$96K/year

no engineering time needed

Both numbers are small next to
the thing they're insuring against:

\$4.44M average breach cost

THE VERDICT

BUILD, if

- ✓ You have a real cloud footprint
- ✓ An engineer who can own ~0.2 FTE ongoing
- ✓ A staging environment to test fixes before prod

Low blast radius: worst case is a missed finding, not an outage — as long as a human holds the merge gate.

BUY (OR SKIP), if

- ✗ No dedicated engineer for ongoing upkeep
- ✗ Pre-Series-A with a small cloud footprint

At that stage you may not need this module at all yet — vendor or DIY.
